26/03/26 Using AI in the SDLC - EE

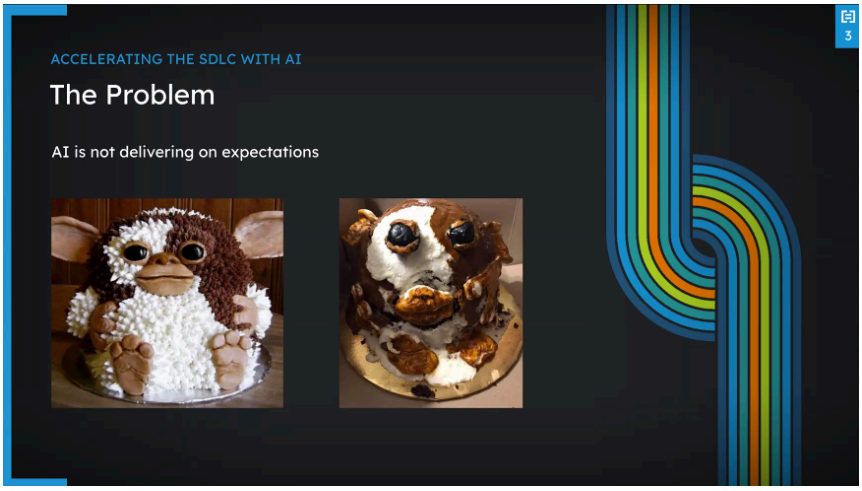
Move away from single prompts, to embedded scalable processes

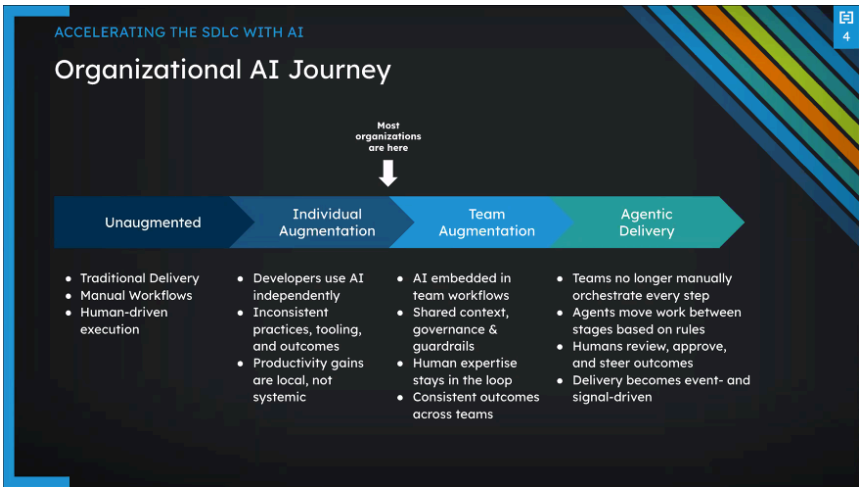
Using Claude Code

Mike Mitchell - Product & Strategy Principal

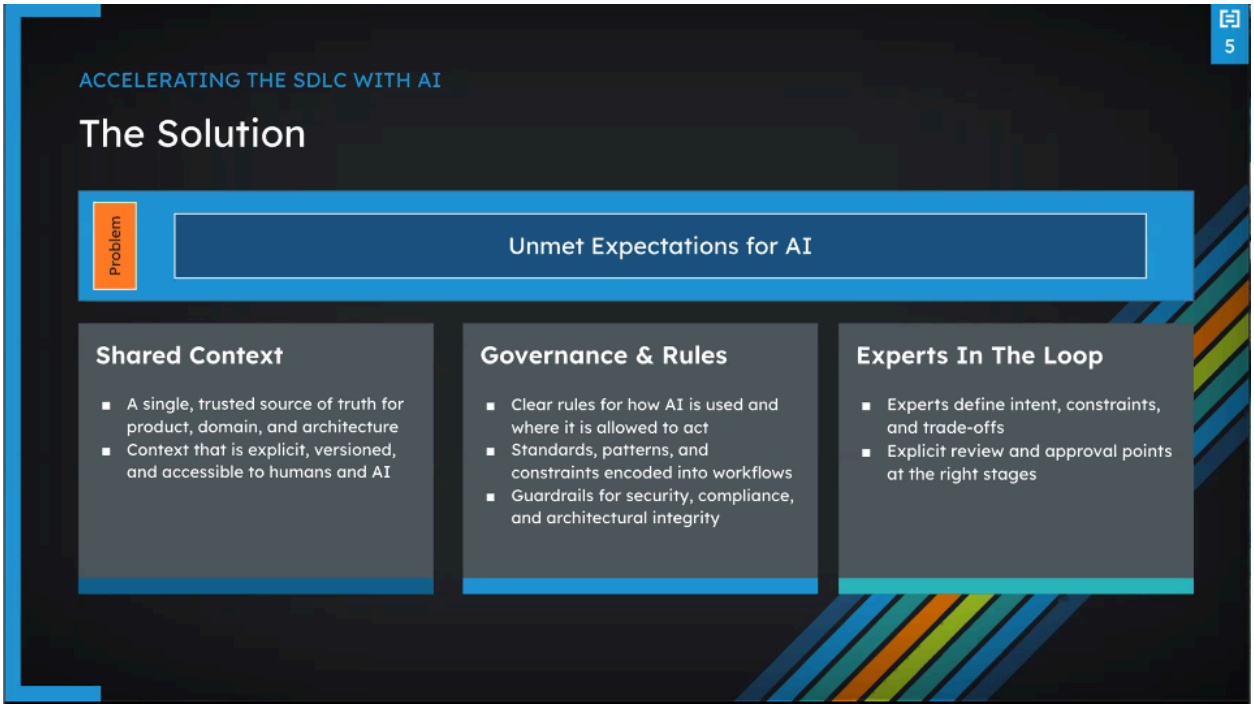
Andy Vays - Technical Principal

95% of AI projects aren't producing any reports - statement from summer 2025

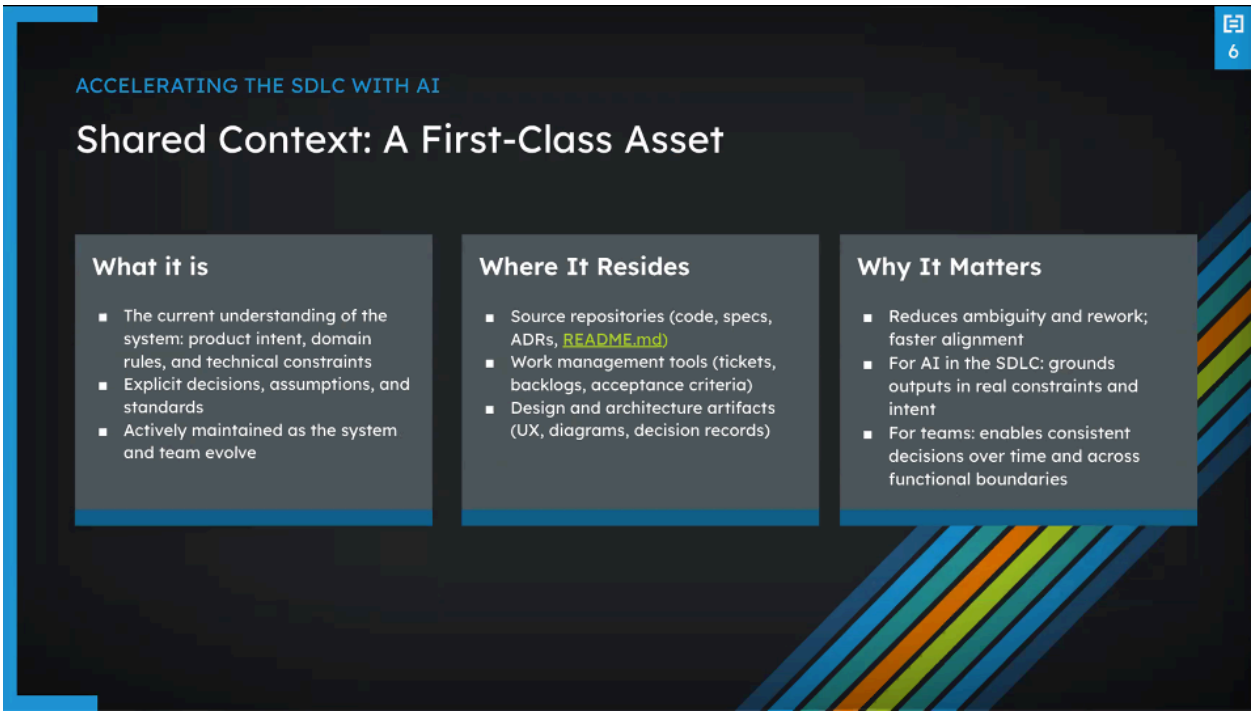




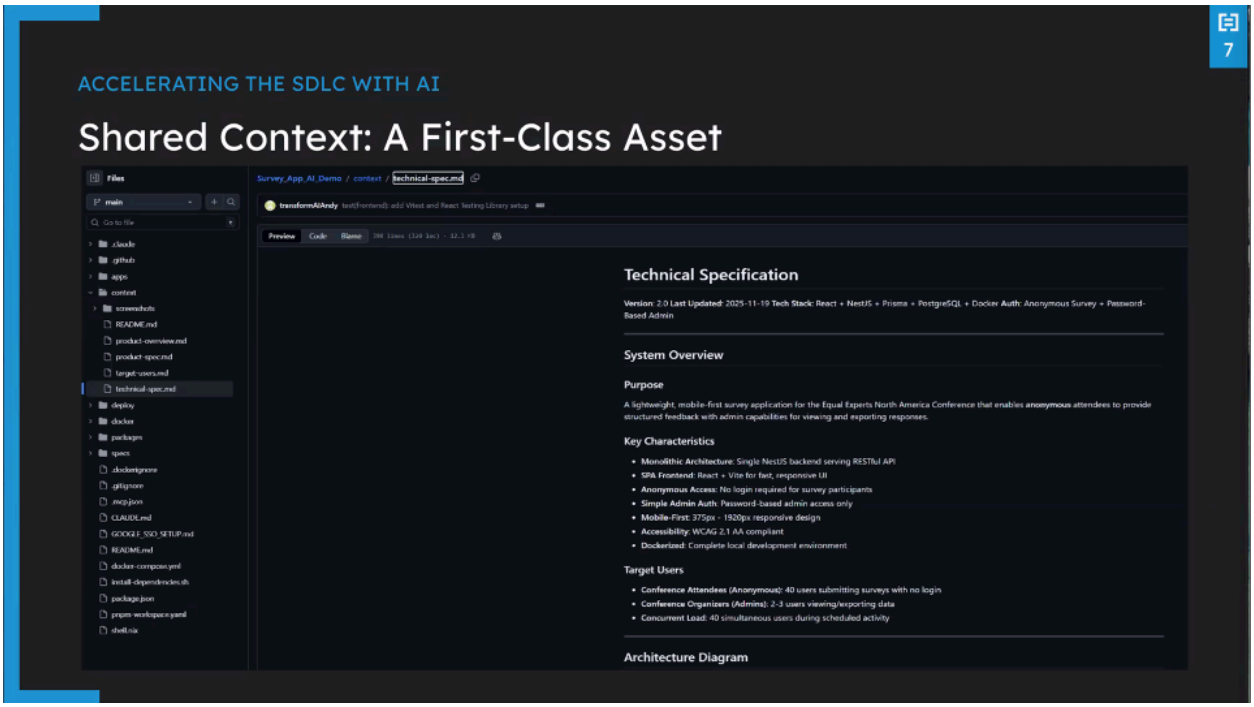
If you want AI to accelerate delivery:



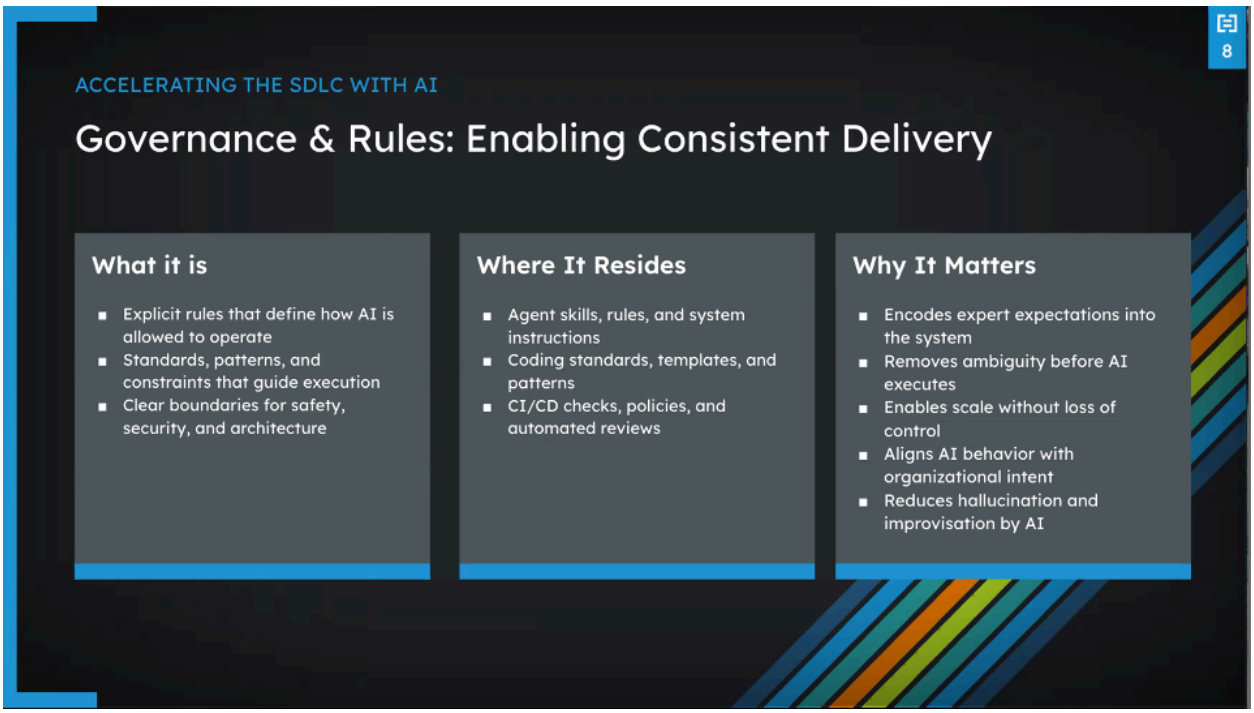
Shared context:

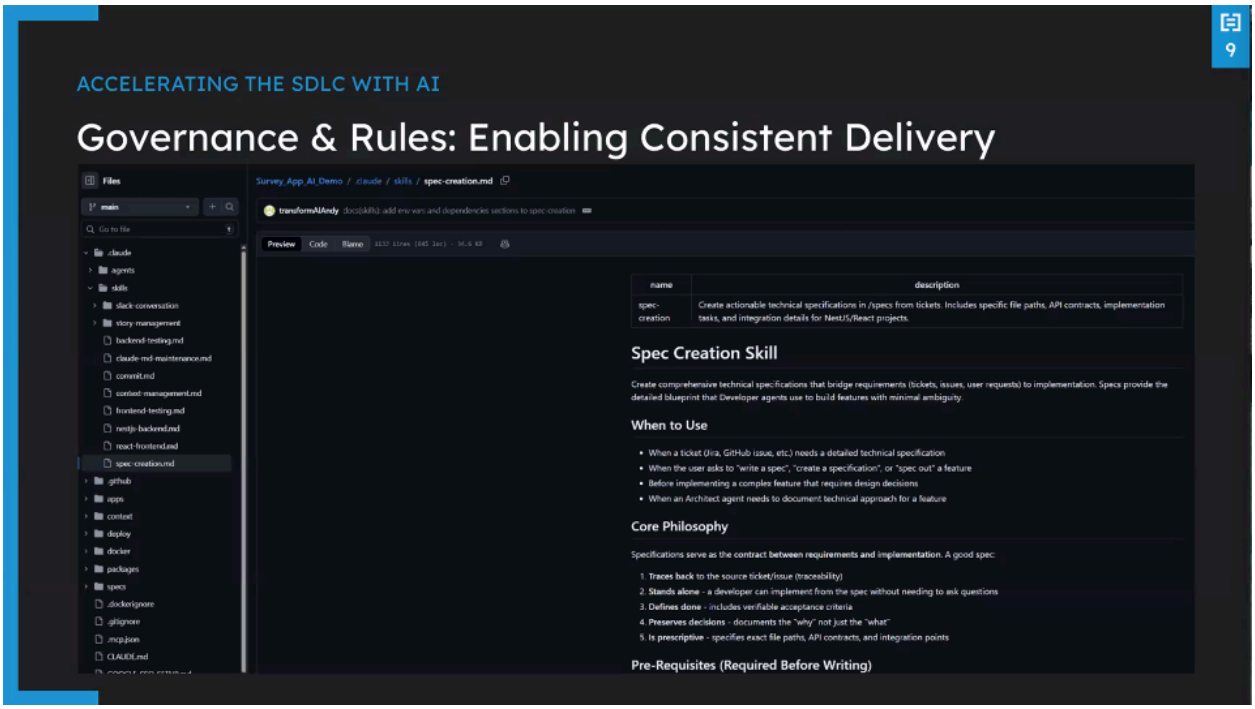


- context needs to be reliable and living artefacts
- so any bugs, features, etc all have the latest context
- helps keep AI aligned with reality

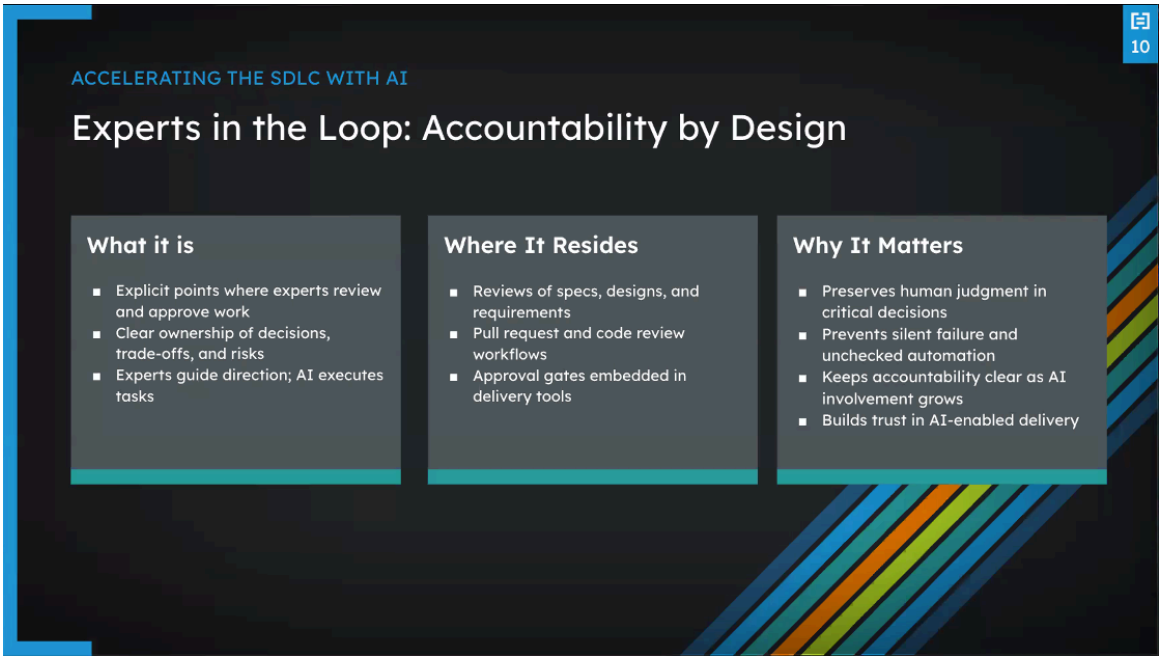


Governance and rules:

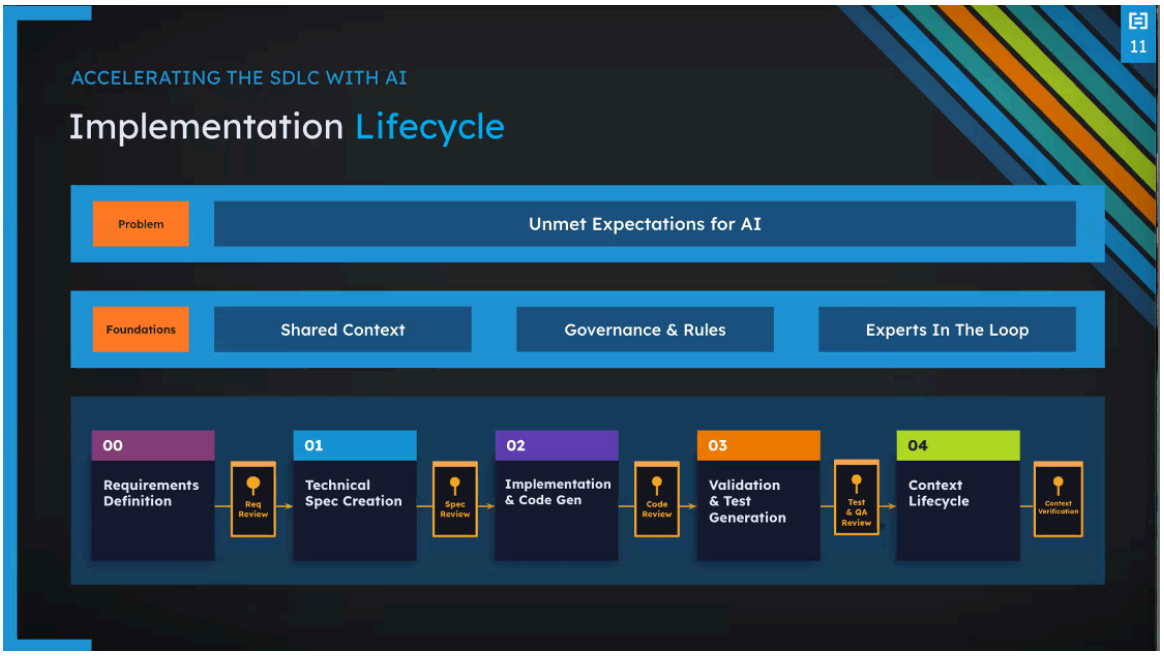


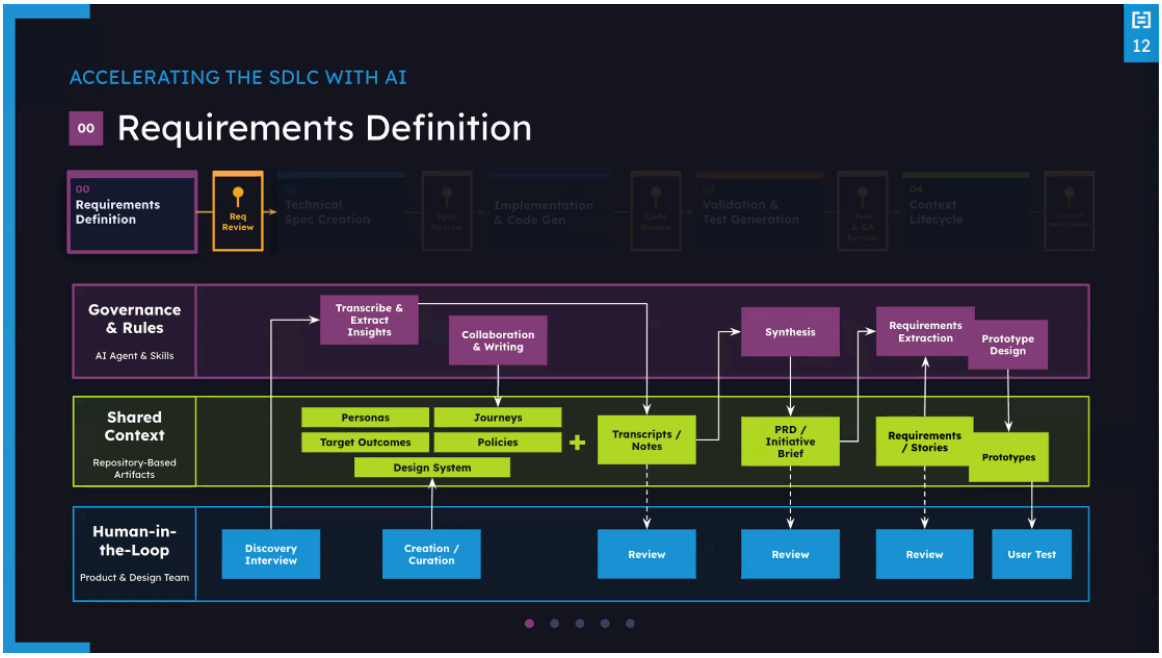


Experts in the loop:



- Ultimately humans are still responsible for the outcome





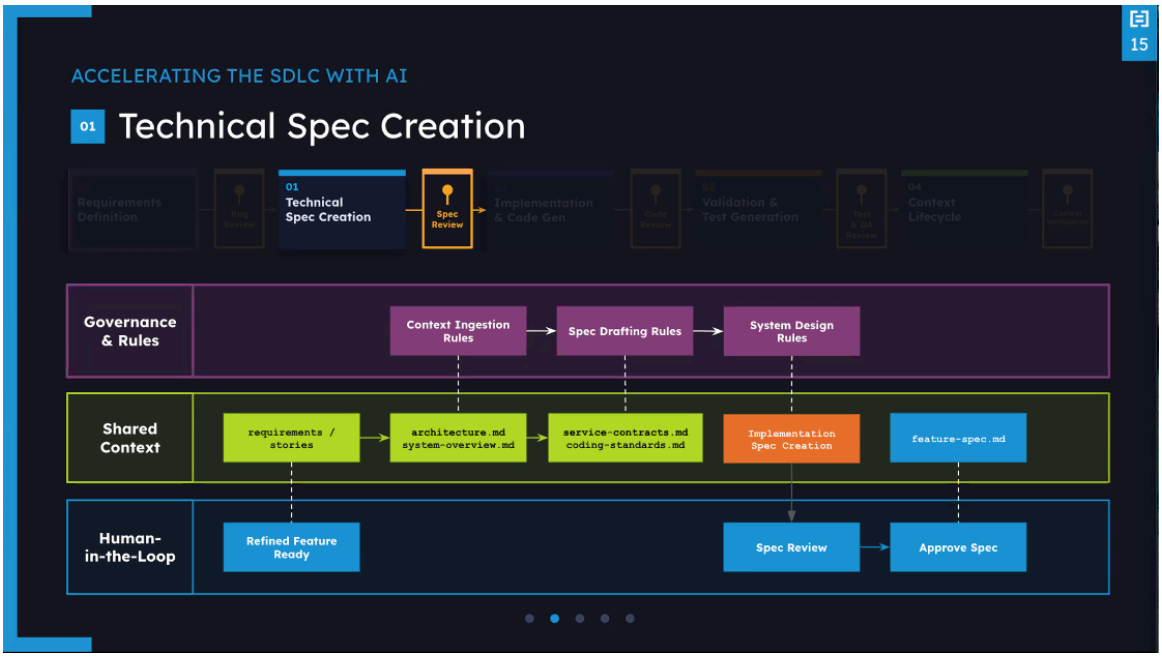
Governance and rules:

- AI agents and skills

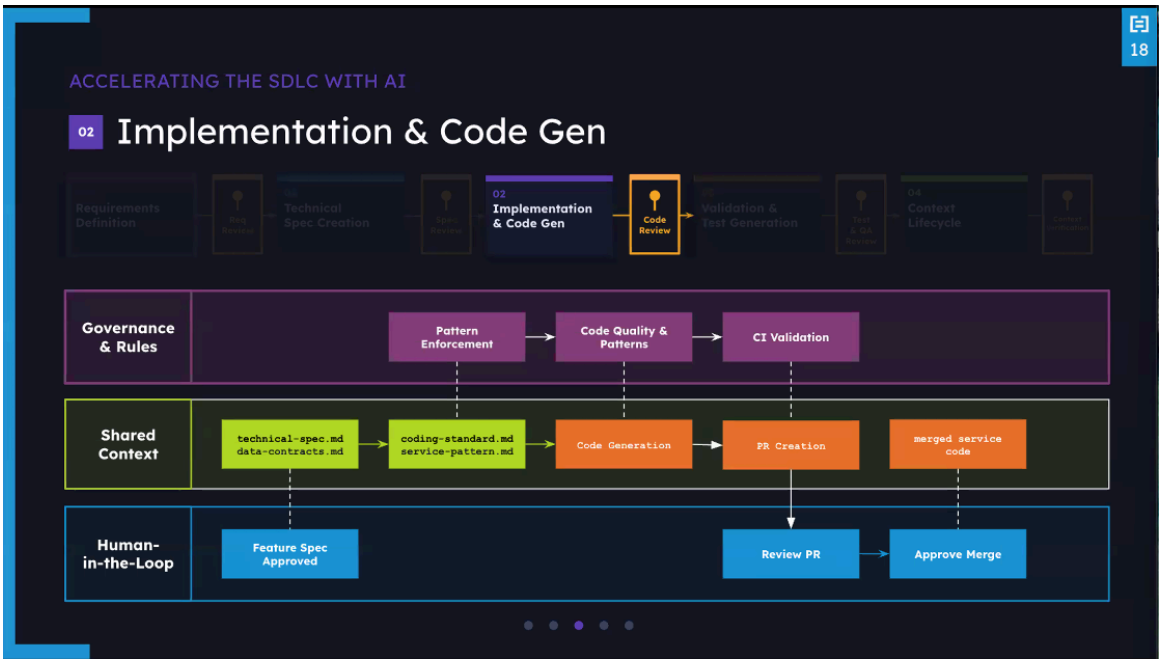
Humans and AI used toe shared context, iterating and constantly defining them

EE demonstrated using Github issues to create new issues, which then started a conversation on Slack, where the AI would ask for more detail. Once more detail was provided, the issue was automatically updated and could be picked up by the AI.

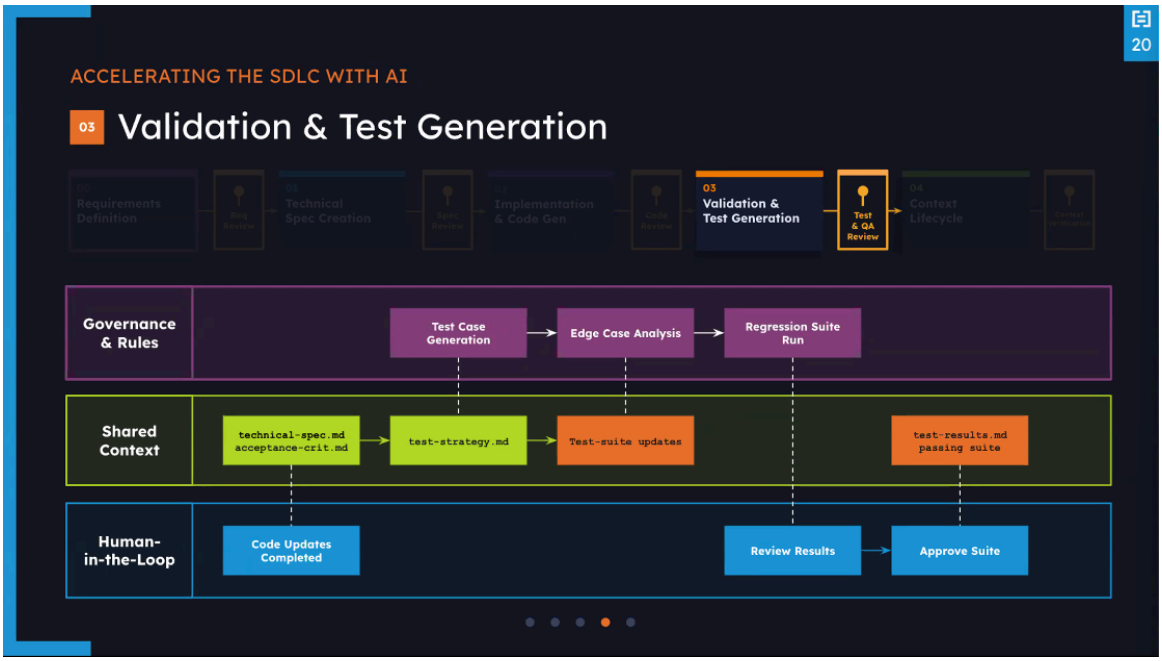
This means, now all requirements, etc are fully in Github!!!

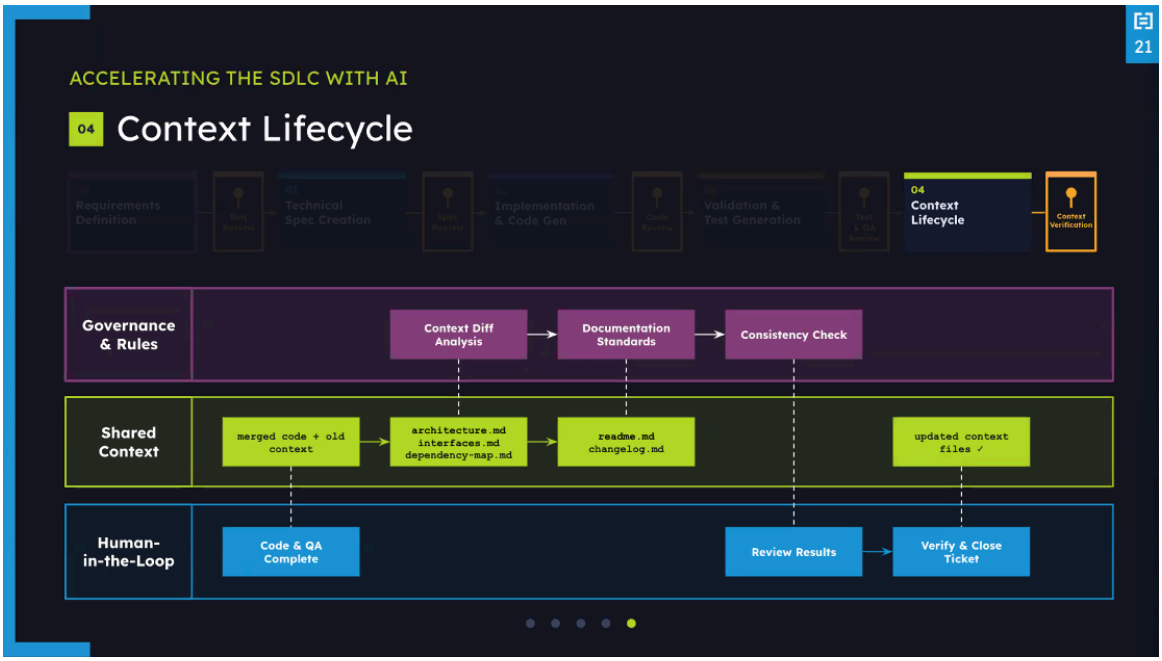


- Spec driven development



- Provide the spec to the LLM

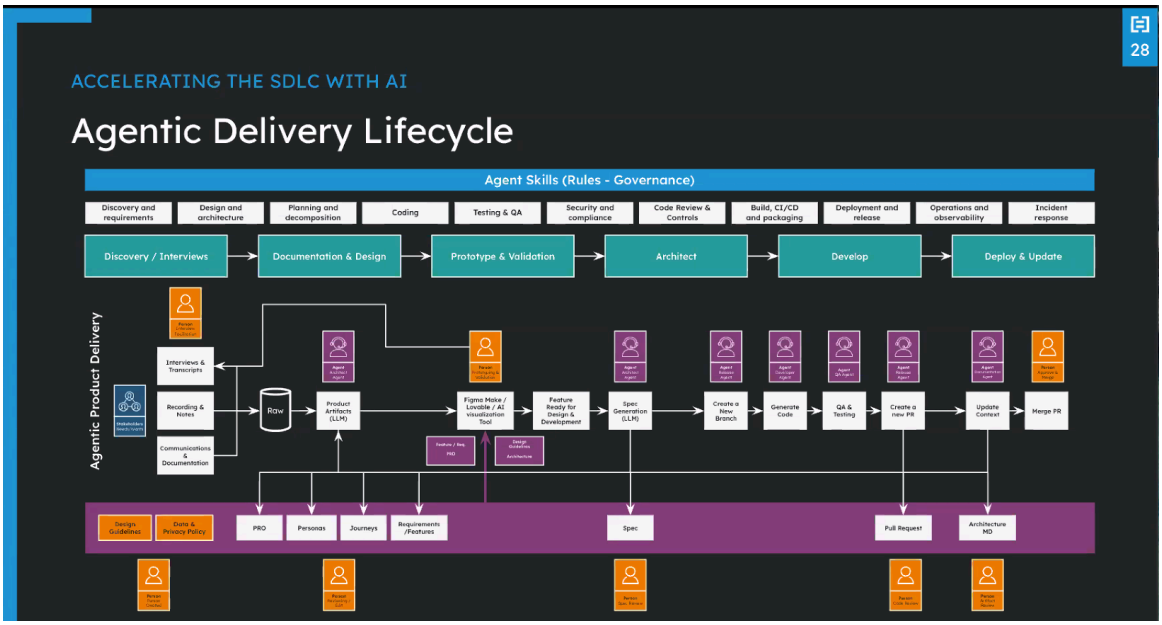


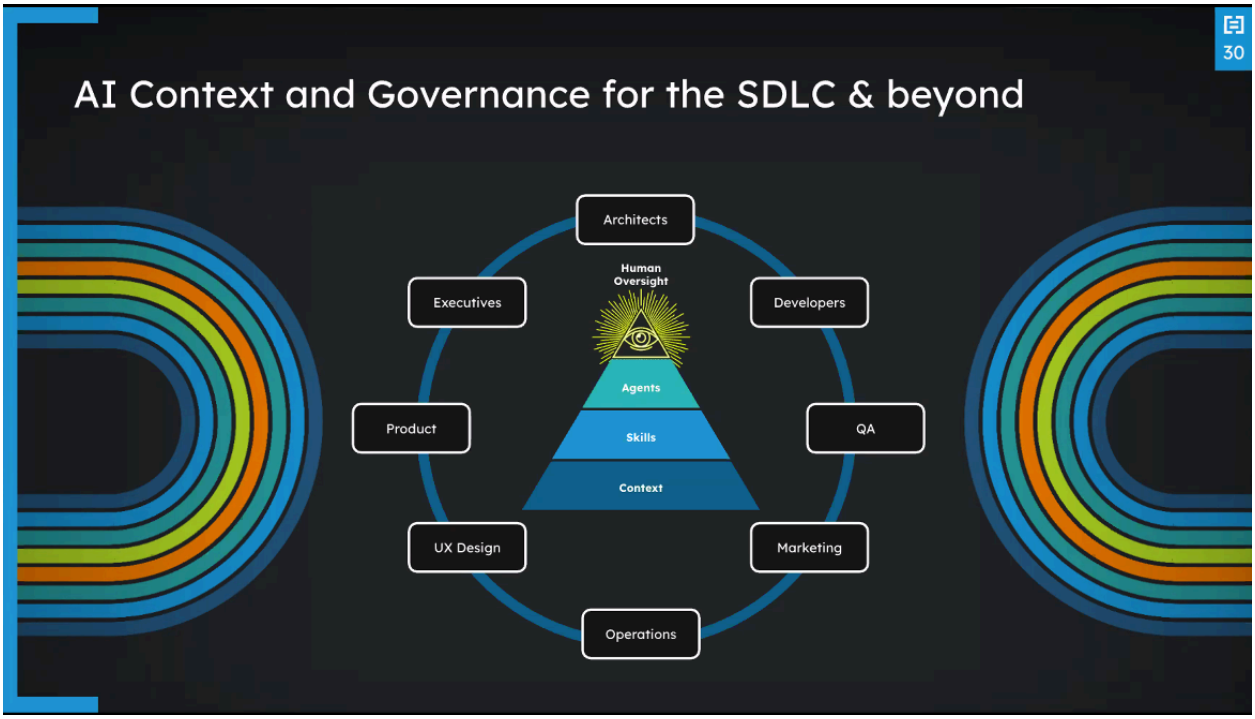


- Treat context like it's part of the code
- Do not let artefacts created at start of project become stale - continue to update context
- Feature isn't complete until it is code complete AND context complete

EE demonstrated how they had a context-manager agent which links to skills. Talks about principles, what needs updating, where to save context, etc

- Everything seems to be markdown files





- Orange: human decisions
